

Protune: Natural Language for the Specification of Rule Based Policies on the Semantic Web

Daniel Olmedilla, Telefonica R&D

Invited Talk at the Business Rules: Extraction, Modelling and Integration Session
23rd European Conference on Operational Research, July 7, 2009, Bonn

01 Introduction

A Broader Notion of Policy

- The term *policy* covers:
 - Security/Privacy policies, Trust management
 - Business rules
 - Quality of Service directives
 - Service-level agreements
 - *and more...*

01 Introduction

Policy Examples

- Business Rules
 - *“Up to 15% of network bandwidth can be reserved by paying with an accepted credit card”*
- Pervasive Computing
 - *“My colleagues can only see the building I am in and only when they are on company premises”*
- Enterprise Collaboration
 - *“Only disclose inventory levels to customers with past due shipments”*
- DoD Scenarios (e.g., coalition forces)
 - *“Only disclose ship departure time after the ship has left”*
 - *“Only disclose information specific to the context of ongoing joint operations”*
- Homeland Security & Privacy (e.g., video surveillance)
 - *“Only allow for facial recognition when a crime scene is suspected”*

02 Challenge

User Awareness & Control

© Scott Adams, Inc./Dist. by UFS, Inc.

- Encourage people to personalize their policies
 - Make it easy for users to write their own rules
- Explain policies and system decisions
 - Make rules & reasoning intelligible to the common user

Natural Language Specification

Policy Explanations

03 Protune Policy Framework

Overview

- provides a **logic-based, declarative** policy language
- features include
 - **trust negotiation**
 - **external actions**
 - access to relational databases,
 - RDF stores,
 - file system requests,
 - time and location-aware packages
 - natural language policy **specification**
 - natural language policy **explanations**
 - *“You cannot access because ...”* (in contrast to just *“Access denied.”*)

04 Natural Language Policy Specification

How does a policy look like?

Policies (typically) are

- machine-understandable
- declarative
- formal syntax
- unintuitive and hard to grasp for users

An example:

$\text{allow}(\text{access}(\text{Requester}, \text{Resource})) \leftarrow$
 $\text{friend}(\text{Requester}), \text{family_picture}(\text{Resource}).$

What could be translated to

If the requester is a friend and the resource is a family-picture then the requester can access the resource.

04 Natural Language Policy Specification

Controlled Natural Language

Is a subset of natural language (NL)

- They are formal languages
 - CNLs have a formal, machine-understandable semantics that is unambiguous

“Bob sees the girl with the telescope.”

“Bob and John are friends. He is my friend, too.”

are always given the same semantics.

- But They do not look like formal languages
 - They are more user-friendly

We use ACE (Attempto Controlled English)

04 Natural Language Policy Specification

ProACE: a Controlled Natural Policy Language

- A subset of the controlled natural language ACE
- Each ProACE can be translated into a Protune policy
 - *“If the requester is older than 18 and she is Bob’s friend then she can access everything which is in ‘adult-content-folder’.”*
 - *“If the requester is a friend and the resource is a family-picture then the requester can access the resource.”*
 - *“If the company of a credit-card is “VISA” then the credit-card is accepted.”*

04 Natural Language Policy Specification

ProACE Mapping Examples

| | |
|---------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| John waits. | <code>wait('John').</code> |
| John greets Sue. | <code>greet('John', 'Sue').</code> |
| John is old. | <code>old('John').</code> |
| Every resource is private. | <code>private(X).</code> |
| John is the murderer. | <code>murderer('John').</code> |
| The murderer is John. | <code>murderer('John').</code> |
| John is in London with Sue. | <code>inWith('John', 'London', 'Sue').</code> |
| John is with Sue in London. | <code>inWith('John', 'London', 'Sue').</code> |
| John is as old as Sue. | <code>asOldAs('John', 'Sue').</code> |
| John is fond-of Sue. | <code>fondOf('John', 'Sue').</code> |
| John is the son of Sue. | <code>'Sue'.son:'John'.</code> |
| John is the son of Sue with Bill. | <code>sonOfWith('John', 'Sue', 'Bill').</code> |
| John's mother waits. | <code>'John'.mother:X, wait(X).</code> |
| If the user is the owner of the file then the user can read the metadata of the file. | <code>allow(read(User, X)) :- File.metadata:X, File.owner:User.</code> |

04 Natural Language Policy Specification

ProACE Editor

Accepted partial sentence

Field for direct text input

Lists for one-by-one word insertion

The screenshot shows the ProACE Editor interface. At the top, the title bar reads "ProACE Editor". Below it is a text input field containing "Every requester" with a red "1" next to it. To the right of this field is a "< Delete" button. Below the text field is a "text" label and a blue text input field containing "can access every" with a red "2" next to it. Below this are six lists of words, each in a blue box with a red "3" next to it:

- properName**: Alice, Bob, John, Mary
- presentIntransitivePredicate**: certifies, sees
- presentTransitivePredicate**: accesses, certifies, contains, retrieves, sees, sends
- presentDitransitivePredicate**: certifies, retrieves, sends
- variable**: X, Y, Z
- function word**: 's, a, an, can, is, of, some

At the bottom right of the interface are "OK" and "Cancel" buttons.

04 Natural Language Policy Specification

LearnWeb 2.0: Natural Language Policies in a social platform

LearnWeb 2.0

Policy text

Everyone who is a relative can see everything which is a photo. Everyone who is a relative can see everything which is a video.

If a file is related to "job" then everyone who is a colleague can access the file.

If a document is protected then if the requester sends a student-id and the student-id's issuer is "unihannover" then the requester can access the document.

Every requester can access everything which is an employee-credential.

Edit Delete

05 Conclusions

Summary

- Protune is a framework where
 - Behavior is flexible
 - Covers many different policy types
 - Policies are rule based, and allow for reasoning
 - Allows for semantic and privacy aware negotiations
 - No previous shared knowledge required
 - Allows for semantic and privacy aware negotiations
 - Provides user awareness and control, i.e.,
 - Natural language policy specification
 - Natural language policy explanations

Demonstration & Prototype

- Demonstration
 - <http://policy.L3S.uni-hannover.de/>
- Prototype available
 - <http://skydev.L3S.uni-hannover.de/gf/project/protune/>
 - Freely distributed
 - All in java
 - Easily configurable, multi-thread
 - Legacy systems integration: RDBMS, LDAP, RDF repositories, ...
